Search Notes

Examiner Duffy,

Please review the attached search results.

If you have any questions or if you would like to refine the search query, please feel free to contact me at any time.

Thank you for using STIC search services!

Paul Schulwitz Technical Information Specialist REM-1A65 571-272-2527

Subject:

SEQUENCE SEARCH 10/077,137

IN RE: 10/077,137

PLEASE SEARCH RESIDUES 1-51 OF SEQ ID NO:1. PLEASE SEARCH RESIDUES 8-41 OF SEQ ID NO:1

VECESVE DEC 15 76 STOPPED LE

PLEASE SEARCH BOTH COMMERCIAL AND INTERFERENCE DATABASES. PLEASE PRINT OUT TOP 75 HITS IN EACH CATEGORY.

THANKS MUCHO.

Patricia A. Duffy, Ph.D. Art Unit 1645 Remsen 3B05; Mailbox 3C18 571-272-0855

```
The specification describes polypeptides that bind April or BAFF. The polypeptides inhibit APRIL or BAFF binding to B-cell maturation antigen (BCMA), APRIL and BAFF are tumor necrosis family (TNF) members. The polypeptides of the invention are useful for treating immune-related diseases, such as rheumatoid arthritis, multiple sclerosis, and systemic lupus erythematosus; cancer such as leukemia, lymphoma, or multiple scleroms or The scleroms or multiple scleroms or diseases (GVHD) and inflammation. The present sequence represents an extracellular domain of BCMA.
                                                                                                                                                                                                                                                                                          New polypeptides that inhibit APRIL and/or BAPF binding to BCMA, useful for treating immune-related disease, cancer or T-cell mediated disease such as graft rejection, graft versus host disease (GVHD) and inflammation.
cytostatic; neoplasm; immunosuppressive; therapeutic; B-cell maturation antigen; BCMA.

The present sequence represents a BCWA (not defined) polypeptide. BCWA is a necrosis factor (NF)-kB activator. The method of the invention is used to indentify compounds which modulate BCMA activity (and thus NF-kB crivity). The specification describes a method of identifying a retivity). The specification describes a method of identifying a library of with a cell which expresses a recombinant anti-cell death gene expression from a promoter. The method is involves context, and then determining whether the expression of the reporter gene is altered as a result of contact with library. The method is useful for identifying polypeptides which increase or decrease gene expression from a promoter. The BCWA polypeptide or nucleic acid are useful for preparing a pharmaceutical composition for treating cancer, apoptosis, viral infections, inflammatory response, such as rheumatory bowel disease or septic shock. BCWA is useful for inflammatory bowel disease or septic shock. BCWA is useful for a contactifying compounds that modulate NF-kB expression and thus for drug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; BR43x2; TACI receptor; extracellular domain; BCMA; B cell protein; transmembrane activator and CAMI-interactor; tumour necrosis factor; TNF; ztnf4 activity; antibody production; autonommune disease; amyloidosis; systemic lupus erythematosus; myasthenia gravis; multiple sclerosis; rheumatoid arthritis; asthma; bronchitis; emphysema; pyelonephritis; renal neoplasm; multiple myelonephritis; venal neoplasm; multiple myelonephritis; venal neoplasm; multiple myelone; lymphoma; light chain neuropathy; immune response; immunosuppression; graft rejection; joint pain; graft versus host disease; inflammation; swelling; anaemia; septic shock; insulin dependent diabetes mellitus; Crohn's disease; hypertension; renal artery stenosis; occlusion; cholesterol; renal emboli.

The present sequence represents a human BCMA protein, a B cell protein related to transmembrane activator and CAML-interactor (TACI) receptor. The receptor. The attendur necrobis factor (TNF) receptor. The extracellular domains of BR43x2 (an isoform of TACI), TACI or BCMA (a related B cell protein) receptor contain a cysteine rich domain, and are used for inhibiting zuff activity. Zaff4 is a TMF ligand. They may also be used for inhibiting zuff4 activity. Zaff4 is a TMF ligand. They may also be used for inhibiting staff activity. The antibody production of the activated or resting B lymphocytes, effector T-cells, or with activated or resting B lymphocytes, effector T-cells, or with activated or resting B lymphocytes, effector T-cells, or with an autibody production. The antibody production is associated with an autibody production. The antibody production systemic lupus erythematosus, myasthenia gravis, multiple sclerosis and rheumatoid arthritis. The zinf4 activity asthma, bronchitis, emphysema, end stage renal failure, associated with asthma bronchitis, emphysema, end stage renal failure, associated with an asthma, multiple myelomas, lymphomas, light chain neuropathy, can be used to treat hypertension, graft versus host disease, inflammation, insulin dependent capection, graft versus host disease, inflammation, insulin dependent septic shock. BR43x2, TACI, and BCMA polypeptides, fusions, antibodies, agonists or antagonists can be used to treat hypertension, renal artery stenosis, or occlusion, and cholesterol or renal emboli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; TNF; tumour necrosis factor; TALL-1; APRIL; TNF receptor; TNFR; TACI; BCMA; therapy; cancer; leukaemia; myeloma; lymphoma; autoimmune disease; rheumatoid arthritis; multiple sclerosis; psoriasis.
                                                                                                                                                                               Inhibiting ztnf4 activity in a mammal, to treat autoimmune diseases, renal disease, graft versus host disease, and inflammation, comprises administering a BR43x2, TACI or BCMA extracellular domain polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to methods of using one or more agonists or antagonists to modulate the activity of the members of TNF (tumour necrosis factor) especially TALL-1, APRIL and TNF receptor (TNFR) e.g. TACI or BCMA. The method is useful for treating pathological conditions or diseases associated with increased TALL-1 and APRIL expression or activity. TALL-1 and APRIL antagonists are used to block the interaction between APRIL and TALL-1 with TACI or BCMA. They are useful for treating a mammal suffering from cancer such as leukaemia, lymphoma, myeloma, cancers of lung and colon and autoimmune diseases e.g. rheumatoid arthritis, multiple sclerosis, psoriasis and lupus erythematosus. The present sequence is human BCMA protein

The present invention relates to Tumour necrosis factor (TNF) and Apolcalated Leucocyte expressed Ligand 1 (TALL-1) nucleic acid molecules, related Leucocyte expressed Ligand 1 (TALL-1) nucleic acid molecules, proteins (including homologues), and their antibodies. The invention in comparing the interaction between TALL computed and their antibodies. The invention in the comparing the interaction between TALL controllers (ECMA referred as B cell maturation factor) to regulate monocyte, macrophage and B lymphocyte mediated immune responses. TALL-1 protein is useful for identifying compounds that regulate B lymphocyte proliferation. It is also useful for treating B lymphocyte associated autoimmune disorders like rheumatoid arthritis, systemic lupus controllers; machenia gravis, Grave's disease, autoimmune haemolytic anaemia, autoimmune thrombocytopenia purpura, Goodpasture's syndrome, contemponding nucleic acid sequence are also useful in diagnostic assays. The present sequence is a human B cell maturation factor (BCMA) protein. The present sequence is a human B cell maturation factor (BCMA) protein. It is the receptor for TALL-1 protein. BCMA gene is located on chromosome contemporation is a human B cell maturation factor (BCMA) protein. It is the receptor for TALL-1 protein. BCMA gene is located on chromosome contemporation is absent in the pro-B lymphocyte stage but its expression contemporation in the pro-B lymphocyte stage but its expression contemporation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human BAFF.R; BAFF receptor; TNF family; immunoregulatory agent; immuno-related disorder; B-cell growth inhibitor; BGMA; becall maturation inhibitor; immuno-related disorder; B-cell jarowth inhibitor; autoimmune disorder; B-cell jymphoproliferative disorder; hypertension; renal disorder; immunosuppressive disorder; HIV infection; organ transplantation; antiinflammatory; systemic lupus erythematosus; autoimmune haemolytic anaemia; Grave's disease; multiple myeloma; B-cell carcinoma; leukaemia; rapidly progressive glomerulonephritis;
                                                                                                                  Isolated TALL-1 protein is used to identify compounds that regulate B lymphocyte proliferation, used to treat B lymphocyte associated autoimmune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   21

The invention relates to the use of a BAFF receptor (BAFF-R, also known as BCMA) protein, or a BAFF-R fusion protein as an agent for the treatment of a variety of immune-related disorders. BAFF-R is a member of the TNF (tumour necrosis factor) the acting as an immunoregulatory agent, and also plays a role in the development of hypertension and related disorders. BAFF-R, fusion proteins containing it, and BAFF-R. Specific antibodies can be used for inhibiting B-cell growth, dendritic cell-induced B-cell growth and maturation, and immunoglobulin production, and in the treatment of autoimmune disorders, B-cell lymphoproliferative disorders, hypertension and renal disorders, R-cell lymphoproliferative be used in the treatment of immunosuppressive disorders and HIV infection, and in patients undergoing organ transplantation. The BAFF-R proteins or BAFF-R specific antibodies may be used for treating, cumpuressing or altering an immune response involving a signalling pathway between BAFF-R and BAFF-R inhibitis inflammation. Since BAFF-R inhibits B-cell growth and maturation it is useful for treating diseases
                                                                                                                                                                                                                                                                                                      Inhibiting dendritic cell-induced B-cell growth, maturation and B-cell lympho-proliferative disorder by administering BAFF-receptor polypeptide, chimeric molecule comprising receptor or anti-BAFF-R antibody homolog.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 such as systemic lupus erythematosus, autoimmune haemolytic anaemia, Grave's disease, multiple myeloma, B-cell carcinomas, leukaemia, rapidly progressive glomerulonephritis, and lymphomas. The invention relates to a method of treating a mammal for a condition associated with undesired cell proliferation such as cancer or carcinoma. The method involves administering a composition comprising A referred with undesired cell proliferation comprising A relation by the control (BCM or BCMA) antagonist that antagonises the metucation protein (BCM or BCMA) antagonist that antagonises the interaction between APRIL and its cognate receptor(s). This method is carcinoma e.g. human lung carcinoma, colon carcinoma, breast carcinoma, carcinoma, breast carcinoma, colon carcinoma, breast carcinoma, colon carcinoma, breast carcinoma, consistent carcinoma, breast carcinoma, colon carcinoma, c

The present sequence is the protein sequence of a human polypeptide encoded by a gene that exhibits decreased expression in colon cancerderived metastases compared to normal colon tissue. It is an example of claimed polypeptides that are encoded by genes which are differentially expressed in metastatic colorectal cancer cells. Such polypeptides are useful in diagnostic and prognostic assays, for raising antibodies useful e.g. in immunotherapy, and in screening for modulator compounds of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New genes that are up- or down-regulated in colorectal cancer, useful for diagnosing colorectal cancer in a subject, or for identifying modulators of colorectal cancer-associated proteins and genes for treating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           the present invention describes a numan tumour neclosity factor designated Zinfill (I). (I) has cytostatic, immunosuppressive, dermatological, antinflammatory, neuroprotective, antidiabetic, antianthratic, antianthratic, antidiabetic, antidiathratic, antianthratic, antidiathratic, and can be used in gene therapy. (I) can be used for activities, and can be used in gene therapy. (I) can be used for (e.g. ZTNR4), for treating disorders and diseases associated with B (C) inhibiting the proliferation of tumour cells. (I) is useful for treating inhibiting the proliferation of tumour cells. (I) is useful for treating cutoimmune disorders such as systemic lupus erythematosus, mysathenia cyrhematoid arthritis, bronchitis, emphysema and end stage renal failure or renal disease such as systemic lupus erythematosus, mysathenia creaming arthritis, and pyelonephritis, and for treating renal cleakemia, nephritis, and pyelonephritis, and for treating renal contents multiple myelomas, lymphomas, light chain neuropathy, or meoplasms, multiple myelomas, lymphomas, light chain neuropathy, or modulating the immune system, for regulating B cell responses and development of other cells, antibody cy production and cytokine production, and for modulating T and B cell communication. The present sequence represents a protein which is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel isolated human tumor necrosis factor receptor polypeptide, termed Ztnfr 12, useful for treating autoimmune disorders, emphysema, end stage renal failure or renal disease and lymphoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a human tumour necrosis factor receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Colorectal cancer; metastasis; differential expression; cytostatic;

The invention relates to fusion proteins comprising transmembrane activator and calcium modulator and cyclophilin ligand-interactor (TACI) receptor group that binds tumnour necrosis factor-like protein (ZYNF)2 or ZYNF4, and an immunoglobulin group comprising a constant region of immunoglobulin. The invention is used to manufacture a medicament for inhibiting the proliferation of tumnour cells in a mammalian subject. The composition comprising the fusion protein may also be used in treating autoimmune diseases (e.g. systemic lupus erythematosus, multiple sclerosis, diabetes mellitus, rheumatoid arthritis and asthma), renal diseases (e.g. apomerulonephritis), bronchitis, inflammation, graft rejection, anaemia and septic shock. The fusion proteins are also used in gene therapy. The present sequence is human B-cell maturation receptor (BCMA) protein used in the invention
                                                                                                                                                                                                                                                                          Transmembrane activator and calcium modulator and cyclophilin ligand-interactor (TACI)-immunoglobulin fusion protein, for treating cancer or diabetes, comprises a TACI receptor group and an immunoglobulin group.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        human; TALL-1; antagonist; immunosuppressive; antirheumatic; antinflammatory; antiarthritic; dermatological; antidiabetic; neuroprotective; antithyroid; antipyretic; nephrotropic; vasotropic; vasotine; autoimmune disease; rheumatoid arthriti; systemic lupus erythematosus; insulin dependent diabetes mellitus; multiple solerosis; myasthaenia gravis; Grave's disease; autoimmune hemolytic anaemia; autoimmune thrombocytopenic purpura; goodpasture's syndrome; pemphigus vulgaris; acute rheumatic fever; post-streptococcal glomerulonephritis; polyarteritis nodosa; BCMA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to the manufacture of a composition for inhibiting the proliferation of tumour cells. The method involves using an antibody component that binds both the B-cell maturation antigen (BCMA) and the transmembrane activator and calcium-modulator and cyclophilin ligand interactor (TACI). BCMA and TACI binding antibody compositions are useful for inhibiting proliferation of tumour cells, particularly inhibiting ZTNF4 activity in a mammal associated with increased endogenous antibody production or a disorder consisting of neoplasm, chronic lymphocytic luckeemia, multiple myeloma, non-Hodgkin's lymphomy or inflammation lymphoproliferative disease or light chain gammopathy or inflammation e.g. asthma. The invention is also useful in gene therapy. The present is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Transmembrane activator; calcium modulator; nephrotropic; antibacterial; TACI; tumour necrosis factor-like protein; ZTNF2; ZTNF4; immunoglobulin; anaemia; gene therapy; cytostatic; antiinflammatory; immunoglobulin; glomerulonephritis; asthma; bronchitis; graft rejection; septic shock; dermatological; neuroprotective; cyclophilin ligand-interactor; human; autoimmune disease; systemic lupus erythematosus; multiple sclerosis; diabetes mellitus; rheumatoid arthritis; renal disease; inflammation; B-cell maturation receptor; BCMA; receptor.

                                                                                                                                                                                                       The invention relates to a novel TALL-1 antagonist protein, comprising a sequence that differs from SEQ ID No.2, or amino acids 134-285 of SEQ ID NO.2, by at least one modification in the region connecting &bgr; strands D and E that reduces the biological activity of the TALL-1 antagonist as compared to wild-type TALL-1. A protein of the invention has immunosuppressive, antitheumatic, antiinfiammatcry, antiarthritic, dermatological, antidiabetic, neuroprotective, antithyroid, antipyretic, nephrotropic, and vasotropic activity. A TALL-1 antagonist may be used in a vaccine. A protein of the invention is useful for inhibiting TALL-1 a vaccine. A protein of the invention is useful for inhibiting TALL-1 a shead in a mammal. TC is useful for treating autoimmune diseases, rheumatoid arthritis, systemic lupus erythematosus, insulin dependent diabetes mellitus, multiple sclerosis, myasthaenia gravis, chrombocytopenic purpura, Goodpasture's syndrome, pemphigus vulgaris, chrombocytopenic purpura, Goodpasture's syndrome, pemphigus vulgaris, acute rheumatic fever, post-streptococcal glomerulonephritis and cut the present sequence represents human BCMA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     dermatological; immunosupecific; tumour necrosis factor delta; TNF-delta; dermatological; immunosuppressive; antiinflammatory; antirheumatic; antiarthritic; cytostatic; antianaemic; antiallergic; antiasthmatic; antipsoritatic; anti-HIV; antiarteriosclerotic; vasotropic; thyromimetic; haemostatic; cancer; autoimmune disease; graft versus host disease; GVHD; inflammatory disorder; proliferative disorder; single chain antibody; antibody; human; BCMA; tumour necrosis factor.
                                                                                                                 Novel TALL-1 antagonist protein useful for inhibiting TALL- 1 biological activity in mammal, has a modification in the region connecting beta strands D and E that reduces the biological activity of TALL-1

                                                                                                                                                                  The present sequence represents a human BCMA polypeptide. The specification also describes TACI and BR3 polypeptides. TACI and BR3 are receptors. Tumour necrosis factor (TNF) family ligands TALL-1 and April bind to the TACI receptor, while TMF family ligands TALL-1 also binds to BR3 receptor. The TACI and BR3 receptor nucleic acid is useful for preparing a composition for treating systemic lupus erythematosus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   haematological malignancy; immunoconjugate; cytostatic; immunostimulant; vaccine; immunotherapy; cancer; multiple myeloma cell; chronic lymphocytic leukaemia; B cell leukaemia; lymphoma; anti-cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               for

The present invention describes an isolated polynucleotide (I), which is overexpressed in haematological malignancies, and which encodes a polypeptide or an immunogenic fragment of the polypeptide. Also

```
described: (1) an isolated polypeptide; (2) an expression vector comprising (1) operably linked to an expression control sequence; (3) a host cell comprising an expression vector; (4) an isolated antibody that specifically binds to the polypeptide or its immunogenic fragment; and (5) immunoconjugates comprising the antibody above, or an antibody that specifically binds to a polypeptide or its immunogenic fragment, encoded (5) immunoconjugates comprising the antibody above, or an antibody that specifically binds to a polypeptide, or its immunogenic fragment, encoded (7). (1) has cytostatic and immunostimulant activities, and can be used in vaccines and immunotherapy. The immunoconjugates are useful in composition for treating cancer, e.g. multiple myeloma cell, chronic composition for treating cancer, e.g. multiple myeloma in humans, sheep, primates, goates, bovines, equines, portines, lupines, canines or felines. The polynucleotide (1) or polypeptide can be used for screening anti-cancer agents, and generating antibodies or immunoconjugates for treating cor preventing the above-mentioned isseases. The polynucleotide, or antibody can be used for detecting, diagnosing or prognosticating the haematclogical malignancies described above. The prognosticating the haematclogical malignancies described above. The present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel method for treating a neurodegenerative immunological disorder, demyelination or Central Nervous System (CNS) inflammation in a mammal. The method comprises administering B-cell maturation antigen (BCMA), or an antibody against BCMA or a BCMA ligand (the mammal has or is at risk of developing multiple sclerosis). The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Treating a neurodegenerative immunological disorder, e.g. demyelination or inflammation in a mammal comprises administering a B-cell maturation antigen (BCMA), an antibody against BCMA or a BCMA ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  human, neurodegenerative immunological disorder, demyelination,

The TACI antibodies are useful for modulating TALL-1 or TACI polypeptide biological activity in mammalian cells, or for diagnosing and treating pathological conditions associated with TNF and TNF receptor-related molecules, e.g. cancer or immune-related disease, such as systemic lupus exthematosus, rheumatoid arthritis, Sjogren's syntrome, systemic vasculitis, diabetes mellitus, Crohn's disease, glomerulonephritis, multiple sclerosis, psoriasis, asthma, urticaria or infectious diseases including ALDS, hepatitis infection, bacterial
method of the invention has neuroprotective, nootropic, and antinflammatory activity, and may have a use in gene therapy. The methods, BCMA, and antibodies are useful for treating a neurodegenerative immunological disorder such as multiple sclerosis, demyelination or CNS inflammation. The present sequence represents human BCMA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New anti-TACI receptor monoclonal antibody, useful for diagnosing and treating pathological conditions associated with tumor necrosis factor, e.g. cancer or immune-related disease, such as rheumatoid arthritis or psoriasis.

This sequence represents neutrokine-alpha, BCWA, which may be used in the protein conjugate of the invention. The neutrokine-alpha protein conjugate of the invention. The neutrokine-alpha protein conjugate comprises neutrokine-alpha protein and chelator, where the conjugate comprises neutrokine-alpha protein (also known as B-lymphocyte stimulator (BLyS), TALL-1, THANK and BARF) is capable of binding neutrokine-alpha receptor and is selected from full length or mature neutrokine-alpha protein. The protein conjugate of the invention is useful in a complex with a metal ion associated with the chelator which is useful for administering radiotherapy, which involves administering the complex to the subject, where it is administered as an injectable solution, and the subject has a B-cell mediated disease. The subject has a condition chosen from non-Hodgkin's lymphoma, chronic lymphocytic leukaemia, multiple myeloma, systemic lupus crythematosus, rheumatodid arthritis, multiple myeloma, systemic lupus creferably non-Hodgkin's lymphoma. The complex is useful for treating cancer, which involves administering it to a subject having cancer, where a cell of the cancer expresses a neutrokine-alpha receptor on its sufface. The cancer is a B cell cancer, which is chosen from non-Hodgkin's lymphoma, multiple myeloma and chronic lymphocytic leukaemia.
                                                                                                                                                                                                                                                                                                                                                                                                   neutrokine-alpha; chelator; B-lymphocyte stimulator; BLyS; TALL-1; THANK; BAFF; neutrokine-alpha receptor; complex; metal ion; radiotherapy; BAFF; neutrokine-alpha receptor; complex; metal ion; radiotherapy; chroinic disease; non-Hodgkin's lymphoma; chronic lymphocytic leukaemia; multiple myeloma; systemic lupus erythematosus; rheumatoid arthritis; multiple sclerosis; crohn's disease; diabetes; Wegener's granulomatosis; myasthenia gravis; asthma; cancer; Sjogren's syndrome; diagnostic imaging; lymphocyte; B cell; cancerous cell; metastasis; lymphatic system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Neutrokine-alpha conjugate useful for targeting complexed metal ion to cells expressing receptor (predominantly lymphoid) for radiotherapy treatment of, for example, non-Hodgkin's lymphoma comprises neutrokinealpha protein and chelator.

ö
The complex is also useful for treating an autoimmune disease or disorder, chosen from systemic lupus erythematosus, rheumatoid arthritis and Sjogram's syndrome. The complex may also be used for disquostic imaging. A composition comprising the protein conjugate or the complex is useful for killing a cell chosen from a cell bearing a neutrokine-alpha receptor, and a cell in close proximity to a cell bearing neutrokine-alpha receptor, which involves contacting the cell bearing neutrokine-alpha receptor. The cell is lymphocyte, B cell or cancerous cell that has metastasised into the lymphatic system.

cc comprising a container, a label on the container and a composition of matter of (7); (9) a method of treating an immune related disease in a cmammal; (10) a method for determining the presence of a PRO polypeptide; in a sample suspected of having the polypeptide; (11) a method of disease or an inflammatory immune response continuaming; (12) a method of identifying a compound that inhibits or mammal; (12) a method of similating the immune response in a mammal. The mimics the activity of or expression of a gene encoding a PRO polypeptide; and (13) a method of stimulating the immune response in a mammal. The CC antisathmatic, antidiabetic, antidiflammatory, antipsoriatic, antidiabetic, immunostimulant, immunosuperssive, muscular, comprortopic, neuroprotective, osteopathic, respiratory, vasotropic and virucide activities, and can be used in gene therapy. The nucleic acid (1) and the encoded polypeptides, compositions, kits and methods are useful in diagnosing and treating an immune related disease and in constant immune response. The present sequence represents a human constant invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            B-lymphocyte; b-cell lymphoma; autoimmune disease; immunosuppressive; non-hodgkin lymphoma; hodgkins disease; cytostatic; chronic lymphocytic leukemia; hairy cell leukemia; rheumatoid arthritis; antiarthritic; antirheumatic; systemic lupus erythematosus; wegener granulomatosis; antiallergic; antiinflammatory; vasotropic; inflammatory bowel disease; gastrointestinal-gen.; inflammatory bowel disease; gastrointestinal-gen.; asthatic thrombocytopenic purpura; hemostatic; multiple sclerosis; asthma; antiasthmatic; psoriasis; antipsoriatic; muscular-gen.; neuroprocective; vasculitis; diabetes; antidiabetic; glomerulonephritis; nephrotropic; BCMA.

population of cells, the method involves contacting the mixed population of cells with BLyS antagonist (e.g. an immunoadhesin) and a CD20 binding antibody (e.g. hu2H7.v16). The method of the invention is useful for treating B cell malignancies and autoimmune disorders, such as: non-Hodgkin's lymphoma, Hodgkin's disease, follicular center cell lymphomas, lymphocytic leukemia, Hairy cell leukemia, rheumatoid arthritis, systemic lupus erythematoous, Wegener's disease, inflammantory bowel disease, idiopathic thrombocytopenic purpura, multiple sclerosis, asthma, psoriasis, IgA nephropathy, myasthenia gravis, vasculitis, diabetes and glomerulonephritis. The present amino acid sequence represents a human
                                                          The invention comprises a method of depleting B cells from a mixed

New tumor necrosis factor receptor (TNFR) polypeptides, useful as detecting ligands, and for modulating tumor growth, metastasis and immunity, such as separating resting from stimulated immune cells.

Disclosure; SEQ ID NO 8; 132pp; English.

In Invalidation provides and polypeptides ADZ67754, expression vectors polynucleocides ADZ67753 and polypeptides ADZ67754, expression vectors and antibodies. Ztnfr14 polynucleotides are used in claimed methods for detecting a genetic abnormality in a patient and for detecting a cancer are partient. Recombinant Ztnfr14 polypeptide, optionally conjugated to toxin, is used in a claimed method of killing cancer cells. Ztnfr14 The invention provides novel tumor necrosis factor receptor ztnfr14

```
The invention describes a method of inhibiting the growth of a cell that expresses a protein comprising contacting the cell with an antibody, cligopeptide or organic molecule that binds to the protein, the binding of free antibody, oligopeptide or organic molecule to the protein and causing an inhibition of growth of the cell. Also described is a method for treating or preventing a cell proliferative disorder associated with increased expression or activity of a protein having at least 80 % amino cid sequence identity to: a polypeptide having any of SEQ ID NO: 2, 8, 10, 12, 16, 20, 22, 49 and 51; a polypeptide having the amino acid sequence of (a), lacking its associated signal peptide; an extracellular sequence of (a), lacking the amino acid sequence of (a), with or without its associated signal peptide; a polypeptide encoded by any of SEQ ID NO: 1, 7, 9, 11, 15, 19, 21, 48 and 50; or a polypeptide encoded by the full-length coding region of the nucleotide sequence of (d), comprising administering to a subject in need of such treatment an antagonist of the protein, and effectively treating or preventing the
                                                                                                                                                                                                                       ö
polypeptides can be used to detect ligands, agonists and antagonists. The polypeptides, polynucleotides and antibodies may also be used in methods that modilate tumor growth, metastasis, and immunity such as separating resting from stimulated immune cells. The present sequence is that of human TNFR BCMA. This sequence was compared with that of ztnfr14 in the identification of ztnfr14 as a member of the TNFR Family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Inhibiting the growth of a cell that expresses a protein by contacting the cell with anti-tumor antigens of hematopoietic origin (TAMO) polypeptide, antibody or organic molecule, useful for treating hematopoietic and malignant tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               protein purification;
                                                                                                                                                                                                                       Gape

The polypeptides inhibit APRIL or BAFF binding to B-cell maturation antigen (BCMA). APRIL and BAFF are tumor necrosis family (TNF) members. The polypeptides of the invention are useful for treating immune-related diseases, such as rheumatoid arthritis, multiple sclerosis, and systemic lupus erythematosus; cancer such as leukemia, lymphoma, or multiple scleroma; or T-cell mediated disease such as graft rejection, graft versus host disease (GVHD) and inflammation. The present sequence
cell proliferative disorder. Also disclosed are anti-tumor antigens of hematopoietic origin (TAHO) polypeptides, encoding nucleic acids, oligopeptides, vectors, host cells and antibodies used in the methods of the invention. The methods and compositions of the present invention are useful for treating hematopoietic and malignant tumors in mammals. This is the amino acid sequence of tumor antigen of hematopoietic origin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        APRIL; BAFF; immune disorder; immunomodulator; antiinflammatory; cancer; cytostatic; neoplasm; immunosuppressive; therapeutic; BCMA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polypeptides that inhibit APRIL and/or BAFF binding to BCMA, useful for treating immune-related disease, cancer or T-cell mediated disease such as graft rejection, graft versus host disease (GVHD) and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The invention relates to the use of a BAFF receptor (BAFF-R, also known as BCMA) protein, or a BAFF-R fusion protein as an agent for the treatment of a variety of immune-related disorders. BAFF-R is a member of the TMF (tumour necrosis factor) family, acting as an immunoregulatory agent, and also plays a role in the development of hypertension and reached disorders. BAFF-R, fusion proteins containing it, and BAFF-R-C related disorders. BAFF-R, fusion proteins containing it, and BAFF-R-C related disorders and be used for inhibiting B-cell growth, dendritic and in the treatment of autoimmune disorders. B-cell lymphoproliferative and in the treatment of autoimmune disorders. B-cell lymphoproliferative cell-induced B-cell growth and maturation, and immunoglobulin production, be used in the treatment of immunosuppressive disorders and HIV concerns or BAFF-R specific antibodies may be used for treating.

C suppressing or altering an immune response involving a signalling pathway between BAFF-R and BAFF, thereby inhibiting inflammation. Since BAFF-R such as systemic lupus erythematosus, autoimmune haemolytic anaemia, cancer as disease, multiple myeloma, B-cell carcinomas, leuksemia, rapidly progressive glomerulonephritis, and lymphomas. human BAFF-R may be used in gene therapy to treat tumours, lymphomas, autoimmune disorders and inherited B-cell-associated disorders. The present sequence represents the BAFF-R fusion protein BAFF-R-FC, comprising a mouse IgG-kappa signal sequence, residues 1-153 of human BAFF-R and a human IgG Fc sequence. ```
The invention relates to a method of treating a mammal for a condition associated with undesired cell proliferation such as cancer or carcinoma. The method involves administering a composition comprising A B relation comprising A B relation comprising A B relation protein Inducing Ligand Receptor (APRIL-R) also referred as B cell maturation protein (BCM or BCMA) antagonist that antagonises the interaction between APRIL and its cognate receptor(8). This method is useful for treating undesired cell proliferation such as cancer or carcinoma e.g. human lung carcinoma, colon carcinoma, breast carcinoma, carcinoma, breast carcinoma, and other carcinomas whose proliferation B modulated by APRIL. It is also useful for treating autoimmune diseases (Grave's disease, systemic lupus erythematosus-SLB); hypertension, cardiovascular diseases, renal disorders, B-cell lympho-proliferative disorders, cimmunosuppressive diseases, organ transplantation, inflammation and human immunodeficiency virus (HIV), and for treating, suppressing or altering on immuno construct containing human APRIL-R also referred as BCMA or BCM protein, Pc region of human immunoglobulin G (IgG) and a signal construct containing human APRIL-R also referred as BCMA or protein, profession of human immunoglobulin G (IgG) and a signal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
         Treating a mammal for a condition associated with undesired cell proliferation such as cancer or carcinoma, comprises administering a composition comprising A Proliferation Inducing Ligand Receptor (APRIL-R)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      human; neurodegenerative immunological disorder; demyelination;

                                                                                                                                                                    The invention relates to a novel method for treating a neurodegenerative immunological disorder, demyelination or Central Nervous System (CNS) inflammation in a mammal. The method comprises administering B-cell maturation antigen (BCMA), or an antibody against BCMA or a BCMA ligand (the mammal has or is at risk of developing multiple sclerosis). The method of the invention has neuroprotective, nootropic, and antiinflammatory activity, and may have a use in gene therapy. The methods, BCMA, and antibodies are useful for treating a neurodegenerative immunological disorder such as multiple sclerosis, demyelination or CNS inflammation. The present sequence is used in the exemplification of the

The present invention relates to the use of an agonist or antagonist of Genoxit activity for preventing or treating obesity. Genoxit is a member of the Tumour Necrosis Factor Receptor Super Family and is a Type III transmembrane protein. The agonists or antagonists of the invention are useful for treating or preventing obesity-related diseases or disorders, e.g. obesity, insulin resistance, atherosels, atheromatous disease, heart disease (e.g. cardiac insufficiency, coronary insufficiency, high blood pressure), hypertension, stroke, syndrome X, diabetes mellitus (type I and II), hyperlipidaemia and hyperuricaemia, also diabetic complications, e.g. microangiopathic lesions, ocular lesions, retinopathy, neuropathy and renal lesions
New use of agonist or antagonist of Genoxit activity for preventing or treating obesity-related diseases or disorders, e.g. hyperlipidemia and atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Chromosome aberration, oncogenic fusion protein, cancer, protein 90; proliferative disease, cellular protein isoform, heat shock protein 90; HSP-90; rheumatoid arthritis, cancer, hematopoietic disorder; T cell lymphona; B cell lymphoma; chronic myeloid leukaemia; CML; acute myeloid leukaemia; AML; APL; NL; solid tumour; papillary thyroid carcinoma; Ewing's sarcoma; melanoma; liposarcoma; rhabdomyosarcoma; synovial sarcoma; viral infection.

                                                                           Inhibiting activity of B cell maturation protein and/or transmembrane activator and intracellular cyclophilin ligand interactor, by administering a binding partner for APRIL, a tumor necrosis factor family
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 diseases such as diarrhoea, psoriasis, allergies, pneumonia, atopic demaritis, respiratory allergic disease (asthma, hypersensitivity lung disease), drug and insect sting allergy, inflammatory bowel disease (Crohn's disease, colltis), scleroderma, autoimmune disease (multiple sclerosis, rheumatoid arthritis, systemic lupus erythematosus), fungal, bacterial, protozoal and viral infections (HIV), atherosclerosis, cancer with leucocyte infiltration of the skin or organs. The present sequence is human BCMA protein extracellular domain
                                                                                                                                                                                                                          The invention relates to a method for inhibiting TACI (transmembrane activator and intracellular CAML interactor) and/or B cell maturation protein (BCMA) activity in a mammal. The method comprises administering specific binding partner for ARRIL (GTO, a tumour necrosis factor-TNF family ligand), having the consensus region of TACI, BCMA, or the TACI BCMA extracellular consensus sequence, but not the extracellular region of TACI and/or BCMA. The method is useful for inhibiting activity of TACI and/or BCMA. The method is useful for inhibiting activity of TACI and/or BCMA in a mammal which is useful for treating B-cell or T-cell symphoproliferative disporders, one or more solid tumours such as lung, gastrointestinal, pancreatic or prostate tumour. ARRIL, BCMA, and TACI entagonists are useful for treating inflammation and immune function
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The invention relates to a method for inhibiting TACI (transmembrane activator and intracellular CAML interactor) and/or B cell maturation protein (BCMA) activity in a mammal. The method comprises administering a specific binding patter for APRIL (G70, a tumour necrosis factor-TNF Eamly ligand), having the consensus region of TACI, BCMA, or the TACI/BCMA extracellular consensus sequence, but not the extracellular region of TACI and/or BCMA. The method is useful for inhibiting activity of TACI and/or BCMA in a mammal which is useful for treating B-cell or T-cell lymphoproliferative discorders, one or more solid tumours such as lung, gastrointeetinal, pancreatic or proseate tumour. APRIL, BCMA and TACI antagonists are useful for treating inflammation and immune function
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Inhibiting activity of B cell maturation protein and/or transmembrane activator and intracellular cyclophilin ligand interactor, by administering a binding partner for APRIL, a tumor necrosis factor family
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               APRIL; BAFF, immune disorder; immunomodulator; antiinflammatory; cancer; cytostatic; neoplasm; immunosuppressive; therapeutic; BCMA; B-cell maturation antigen; Fc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 dereases such as diarrhoea, psoriasis, allergies, pneumonia, atopic dematitis, respiratory allergic disease (asthma, hypersensitivity lung dermatitis, respiratory allergic disease (asthma, hypersensitivity lung disease), drug and insect sting allergy, inflammatory bowel disease (Crohn's disease, collitis), scleroderma, autoimmune disease (multiple sclerosis, rheumatoid arthritis, systemic lupus erythematosus), fungal, bacterial, protozoal and viral infections (HIV), atheroscise, cancer with leucocyte infiltration of the skin or organs. The present sequence is human BCMA protein-immunoglobulin Fc region fusion protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1 MAGQCSQNEYFDSLLHACIPCQLRCSSNTPPLTCQRYCNASVTNSVKG 48

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method for inhibiting TACI (transmembrane activator and intracellular CAML interactor) and/or B cell maturation protein (SCAM) activity in a mammal. The method comprises administering a pecific binding partner for APRIL (G70, a tumour necrosis factor-TNF family ligand), having the consensus region of TACI, BCMA, or the TACI/BCMA extracellular consensus sequence, but not the extracellular region of TACI or BCMA. The method is useful for inhibiting activity of TACI and/or BCMA in a mammal which is useful for inhibiting activity of TACI and/or BCMA in a mammal which is useful for treating B-cell or T-cell lymphoproliferative disorders, one or more solid tumours such as lung, gastrointestinal, pancreatic or prostate tumour. APRIL, BCMA and TACI antagonists are useful for treating inflammation and immune function diseases such as diarrhoea, psoriasis, allergies, pneumonia, atopic diseases uch as diarrhoea, psoriasis, allergies, pneumonia, atopic disease, drug and insect sting allergy, inflammatory bowel disease (Crohn's disease, colitis), scleroderma, autoimmune disease (multiple sclerosis, rheumatoid arthitis, systemic lupus erythematosus), fungal, bacterial, protozoal and viral infections (HIV), atherosclerosis, cancer the present sequence the bacterial, protozoal and viral infections (HIV), atherosclerosis, cancer the present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cytostatic; B cell maturation protein; BCMA; tumour necrosis factor; TNF; lymphoproliferative disorder; tumour; lung; gastrointestinal; pancreatic; prostate; inflammation; immune disorder; diarrhoea; psoriasis; colitis; drug allergy; dermatitis; pneumonia; asthma; inflammatory bowel disease; Crohn's disease; scleroderma; autoimmune disease; multiple sclerosis; human immunodeficiency virus; HIV; systemic lupus erythematosus; cancer; rheumatoid arthritis; atherosclerosis; fusion protein.
                                                                                                                                                                                                                                                                                                                                                                                                    Inhibiting activity of B cell maturation protein and/or transmembrane activator and intracellular cyclophilin ligand interactor, by administering a binding partner for APRIL, a tumor necrosis factor family

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; transmembrane activator and intracellular CAML interactor; TACI; cytostatic; B cell maturation protein; BCMA; tumour necrosis factor; TNF; lymphoproliferative disorder; tumour; lung; gastrointestinal; pancreatic; prostate; inflammation; immune disorder; diarrhoea; psoriasis; colitis; drug allergy; demmatitis; pneumonia; asthma; inflammatory bowel disease; Crohn's disease; scleroderma; autoimmune disease; multiple sclerosis; human immunodeficiency virus; HIV; systemic lupus erythematosus; cancer;
                                                                                                                                                                                                                    The specification describes polypeptides that bind April or BAFF. The polypeptides inhibit APRIL or BAFF binding to B-cell maturation antigen (BCMA). APRIL and BAFF are tumor necrosis family (TMF) members. The polypeptides of the invention are useful for treating immune-related diseases, such as rheumatoid arthritis, multiple sclerosis, and systemic lupus erythematosus; cancer such as leukemia, lymphoma, or multiple scleroward or T-cell mediated disease such as graft rejection, graft versus host disease (GVHD) and inflammation. The present sequence represents a BCMA-Fc fusion protein, where I22 of BCMA is changed to Lys.
                                                                                                                                      New polypeptides that inhibit APRIL and/or BAFF binding to BCMA, useful for treating immune-related disease, cancer or T-cell mediated disease such as graft rejection, graft versus host disease (GVHD) and
                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The invention relates to a method for inhibiting TACI (transmembrane activator and intracellular CAML interactor) and/or B cell maturation protein (BCMA) activity in a mammal. The method comprises administering a pecific binding partner for APRIL (G70, a tumour necrosis factor-TNF family ligand), having the consensus region of TACI, BCMA, or the TACI/ BCMA extracellular consensus sequence, but not the extracellular region of TACI or BCMA. The method is useful for inhibiting activity of TACI or TACI or BCMA in a mammal which is useful for treating B-cell or T-cell lymphoproliferative disorders, one or more solid tumours such as lung, gastrointestinal, pancreatic or prostate tumour. APRIL, BCMA and TACI cantagonists are useful for treating inflammation and immune function diseases such as diarrhoea, psoriasis, allergies, pneumonia, atopic dermatitis, respiratory allergic disease (asthma, hypersensitivtic) ung disease, colitis), scleroderma, autoimmune disease (multiple sclerosis, rheumatoid arthritis, systemic lupus erythematosus), fungal, sclerosis, rheumatoid arthritis, systemic lupus erythematosus), fungal, bacterial, protozoal and viral infections (HIV), atherosclerosis, cancer with leucocyte infiltration of the skin or organs. The present sequence is human BCMA cysteine-rich extracellular region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                    Inhibiting activity of B cell maturation protein and/or transmembrane activator and intracellular cyclophilin ligand interactor, by administering a binding partner for APRIL, a tumor necrosis factor family
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                             The invention provides novel tumor necrosis factor receptor zinfild polynucleotides ADZ67753 and polypeptides ADZ67754, expression vectors and antibodies. Zinfil4 polynucleotides are used in claimed methods for detecting a genetic abnormality in a patient and for detecting a cancer in a patient. Recombinant zinfil4 polypeptide, optionally conjugated to a toxin, is used in a claimed method of killing cancer cells. Zinfil4 polypeptides can be used to detect ligands, agonists and antagonists. The polypeptides can be used to detect ligands, agonists and antagonists. The polypeptides, polynucleotides and antibodies may also be used in methods that modulate tumor growth, metastasis, and immunity such as separating resting from stimulated immune cells. The present sequence is that of the Cys-rich domain of human TNFR BCMA ADZ67760. This sequence was compared with that of zinfil4 in the identification of zinfil4 as a member of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               APRIL; BAFP; immune disorder; immunomodulator; antiinflammatory; cancer; cytostatic; neoplasm; immunosuppressive; therapeutic; B-cell maturation antigen; BCMA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      for treating immune-related disease, cancer or T-cell mediated disease such as graft rejection, graft versus host disease (GVHD) and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
detecting ligands, and for modulating tumor growth, metastasis and immunity, such as separating resting from stimulated immune cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polypeptides that inhibit APRIL and/or BAFF binding to BCMA,

The specification describes polypeptides that bind April or BAFF. The polypeptides inhibit APRIL or BAFF binding to B-cell maturation antigen (BCMA). APRIL and BAFF are tumor necrosis family (TNF) members The polypeptides of the invention are useful for treating immune-related diseases, such as rheumatoid arthritis, multiple sclerosis, and systemic lupus erythematosus; cancer such as leukemia, lymphoma, or multiple

BAFF-R is a member of the TNF (tumour necrosis factor) family, acting as an immunoregulatory agent, and also plays a role in the development of hypertension and related disorders. BAFF-R, fusion proteins containing it, and BAFF-R specific antibodies can be used for inhibiting B-cell growth, dendritic cell-induced B-cell growth and maturation, and immunoglobulin production, and in the treatment of autoimmune disorders, BAFF-R proteins also be used in the treatment of immunosuppressive disorders and HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Inhibiting dendritic cell-induced B-cell growth, maturation and B-cell lympho-proliferative disorder by administering BAFF-receptor polypeptide, chimeric molecule comprising receptor or anti-BAFF-R antibody homolog.
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human BAFF-R; BAFF receptor; TNF family; immunoregulatory agent; immune-related disorder; B-cell growth inhibitor; BCMA; B-cell maturation inhibitor; immunoglobulin production inhibitor; autoimmune disorder; B-cell lymphoproliferative disorder; hypertension; renal disorder; immunosuppressive disorder; HIV infection; organ transplantation; antiinflammatory; systemic lupus erythematosus; autoimmune haemolytic anaemia; Grave's disease; multiple myeloma; B-cell carcinoma; lenkaemia; rapidly progressive glomerulonephritis; lymphoma; gene therapy; cancer; tumour; plasmid pJST535.
                                                                                                                                                   Gaps
scleroma; or T-cell mediated disease such as graft rejection, graft versus host disease (GVHD) and inflammation. The present sequence represents an extracellular domain of BCMA.

```
The invention relates to a method for inhibiting TACI (transmembrane activator and intracellular CAML interactor) and/or B cell maturation protein (BCMA) activity in a mammal. The method comprises administering a specific binding partner for AFRIL (G70, a tumour necrosis factor-INF
proteins or BAFF-R specific antibodies may be used for treating, between BAFF-R specific antibodies may be used for treating, between BAFF-R and altering an immune response involving a signalling pathway between BAFF-R and BAFF, thereby inhibiting inflammation. Since BAFF-R inhibits B-cell growth and maturation it is useful for treating diseases such as systemic lupus erythematosus, autoimmune haemolytic anaemia, grave's disease, multiple myelom, B-cell carcinomas, leukaemia, rapidly progressive glomerulonephritis, and lymphomas. Nucleic acids encoding human BAFF-R may be used in gene therapy to treat tumours, lymphomas, autoimmune disorders and inherited B-cell-associated disorders. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; transmembrane activator and intracellular CAML interactor; TACI; cytostatic; B cell maturation protein; BCMA; tumour necrosis factor; TNF; lymphoproliferative disorder; tumour; lung; gastrointestinal; pancreatic; prostate; inflammation; immune disorder; diarrhoea; psoriasis; colitis; drug allergy; dermatitis; pneumonia; asthma; inflammatory bowel disease; crown's disease; scleroderma; autoimmune disease; multiple sclerosis; human immunodeficiency virus; HIV; systemic lupus erythematosus; cancer; rheumatoid arthritis; atherosclerosis.

family ligand), having the consensus region of TACI, BCWA, or the TACI/
BCWA extracellular consensus sequence, but not the extracellular region
of TACI or BCWA. The method is useful for inhibiting activity of TACI
and/or BCWA in a mammal which is useful for treating B-cell or T-cell
indicates and an ammal which is useful for treating B-cell or T-cell
Imphoproliferative disorders, one or more solid tumours such as lung,
gastrointestinal, pancreatic or prostert tumour. ARXIL, BCWA and TACI
antagonists are useful for treating inflammation and immune function
diseases such as diarrhoea, psoriasis, allergies, pneumonia, atopic
dermatitis, respiratory allergic disease (asthma, hypersensitivty lung
disease), drug and insect sting allergy, inflammatory bowel disease
(Crohn's disease, colltis), scleroderma, autoimmune disease (multiple
sclerosis, rheumatoid arthritis, systemic lupus erythematosus), fungal,
bacterial, protozoal and viral infections (HIV), atherosclerosis, cancer
with leucocyte infiltration of the skin or organs. The present sequence
is human BCWA protein cysteine-rich consensus region
                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The invention relates to a novel TALL-1 antagonist protein, comprising a sequence that differs from SEO ID NO:2, or amino acids 134-285 of SEO ID NO:2, by at least one modification in the region connecting &bgr; strands or and E that reduces the biological activity of the TALL-1 antagonist as compared to wild-type TALL-1. A protein of the invention has immunosuppressive, antitheumatic, antifilammatory, antithyroid, antidiabetic, neuroprotective, antithyroid, antidyretic, neuroprotective, antithyroid, antipyretic, nephrotropic, and vasotropic activity. A TALL-1 antagonist may be used in a vaccine. A protein of the invention is useful for treating TALL-1 biological activity in a mammal. TC is useful for treating autoimmune diseases, rheumatoid arthritis, systemic lupus erythematosus, insulin dependent diabetes mellitus multiple sclerosis, myasthaenia gravis, Grave's disease, autoimmune hemolytic anaemia, autoimmune thromatic fever, post-streptococcal glomerulonephritis and cute rheumatic fever, post-streptococcal glomerulonephritis and collabora. The present sequence represents a cysteine rich domain (CRD) module of human BCMA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The specification describes polypeptides that bind April or BAFF. The polypeptides inhibit APRIL or BAFF binding to B-cell maturation antigen (BCMA). APRIL and BAFF are tumor necrosis family (TNF) members. The polypeptides of the invention are useful for treating immune-related diseases, such as rheumatoid arthritis, multiple sclerosis, and systemic lupus erythematosus; cancer such as leukemia, lymphoma, or multiple scleroma; or T-cell mediated disease such as graft rejection, graft
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               APRIL; BAFF; immune disorder; immunomodulator; antiinflammatory; cancer; cytostatic; neoplasm; immunosuppressive; therapeutic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polypeptides that inhibit APRIL and/or BAFF binding to BCMA, useful for treating immune-related disease, cancer or T-cell mediated disease such as graft rejection, graft versus host disease (GVHD) and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The specification describes polypeptides that bind April or BAFF. The polypeptides inhibit APRIL or BAFF binding to B-cell maturation antigen (BCMA). APRIL and BAFF are tumor necrosis family (TNF) members. The polypeptides of the invention are useful for treating immune-related diseases such as rheumatoid arthritis, multiple sclerosis, and systemic lupus erythematosus; cancer such as leukemia, lymphoma, or multiple scleroma; or T-cell mediated diseases such as graft rejection, graft versus host diseases (GVHD) and inflammation. The present sequence represents a polypeptide of the invention, derived from formula II (see AEC02021), that that bind BAFF.
                                                                                                                                                                                                                                                                                                                                                                                            APRIL; BAFF; immune disorder; immunomodulator; antiinflammatory; cancer; cytostatic; neoplasm; immunosuppressive; therapeutic.
versus host disease (GVHD) and inflammation. The present sequence represents a polypeptide of the invention, derived from formula II (see AEC02021), that that bind BAFF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polypeptides that inhibit APRIL and/or BAFF binding to BCMA, useful

The specification describes polypeptides that bind APRIL or BAFF. The polypeptides inhibit APRIL or BAFF binding to B-cell maturation antigen (BCWA). APRIL and BAFF are tumor necrosis family (TNF) members. The polypeptides of the invention are useful for treating immune-related diseases, such as rheumatoid arthritis, multiple sclerosis, and systemic lupus erythematosus; cancer such as leukemia, lymphoma, or multiple sclerosis or content as leukemia, prymphoma, or multiple sclerosis of diseases (GWHD) and inflammation. The present sequence represents polypeptide of the invention that binds APRIL, derived from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       APRIL; BAPF; immune disorder; immunomodulator; antiinflammatory; cancer; cytostatic; neoplasm; immunosuppressive; therapeutic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New polypeptides that inhibit APRIL and/or BAFF binding to BCMA, useful
                                                                                                                                                                                                                                     New polypeptides that inhibit APRIL and/or BAFF binding to BCMA, useful for treating immune-related disease, cancer or T-cell mediated disease such as graft rejection, graft versus host disease (GVHD) and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The specification describes polypeptides that bind April or BAFF. The polypeptides inhibit APRIL or BAFF binding to B-cell maturation antigen (BCMA). APRIL and BAFF are tumor necrosis family (TNF) members. The polypeptides of the invention are useful for treating immune-related diseases, such as rheumatoid arthitis, multiple sclerosis, and systemic lupus erythematosus; cancer such as leukemia, lymphoma, or multiple scleromi; or T-cell mediated disease such as graft rejection, graft versus host disease (GVHD) and inflammation. The present sequence represents a polypeptide of the invention, derived from formula II (see AEC02021), that that bind BAFF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               APRIL; BAFF; immune disorder; immunomodulator; antiinflammatory; cancer; cytostatic; neoplasm; immunosuppressive; therapeutic.
                                                                                                                                                                          APRIL; BAFF; immune disorder; immunomodulator; antiinflammatory; cancer; cytostatic; neoplasm; immunosuppressive; therapeutic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New polypeptides that inhibit APRIL and/or BAFF binding to BCMA, useful for treating immune-related disease, cancer or T-cell mediated disease such as graft rejection, graft versus host disease (GVHD) and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The specification describes polypeptides that bind April or BAFF. The polypeptides inhibit APRIL or BAFF binding to B-cell maturation antigen BCMA). APRIL and BAFF are tumor necrosis family (TNF) members. The polypeptides of the invention are useful for treating immune-related diseases, such as rheumatoid arthritis, multiple sclerosis, and systemic lupus erythematosus; cancer such as leukemia, lymphoma, or multiple scleroms, or T-cell mediated disease such as graft rejection, graft versus host disease (GYHD) and inflammation. The present sequence represents a polypeptide of the invention, derived from formula II (see
                                                                                                                    The specification describes polypeptides that bind April or BAFF. The polypeptides inhibit APRIL or BAFF binding to B-cell maturation antigen (BCMA). APRIL and BAFF are tumor necrosis family (TNF) members. The polypeptides of the invention are useful for treating immune-related diseases, such as rheumatoid arthritis, multiple solerosis, and systemic lupus erythematosus; cancer such as leukemia, lymphoma, or multiple soleromi, or T-cell mediated disease such as graft rejection, graft versus host disease (GVHD) and inflammation. The present sequence represents a polypeptide of the invention, derived from formula II (see AEC02021), that that bind BAFF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             APRIL; BAFF; immune disorder; immunomodulator; antiinflammatory; cancer; cytostatic; neoplasm; immunosuppressive; therapeutic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The specification describes polypeptides that bind APRIL or BAFF. The polypeptides inhibit APRIL or BAFF binding to B-cell maturation antigen (BCMA). APRIL and BAFF are tumor necrosis family (TNF) members. The polypeptides of the invention are useful for treating immune-related diseases, such as rheumatoid arthritis, multiple sclerosis, and systemic lupus erythematosus; cancer such as leukemia, lymphoma, or multiple scleromia or T-cell mediated disease such as graft rejection, graft versus host disease (GVHD) and inflammation. The present sequence

The specification describes polypeptides that bind April or BAFF. The polypeptides inhibit APRIL or BAFF binding to B-cell maturation antigen (BCWA). APRIL and BAFF are tumor necrosis family (TNF) members. The polypeptides of the invention are useful for treating immune-related diseases, such as rheumatoid arthritis, multiple sclerosis, and systemic lupus erythematosus; cancer such as leukemia, lymphoma, or multiple scleromi, or T-cell mediated disease such as graft rejection, graft versus host disease (GVHD) and inflammation. The present sequence represents a polypeptide of the invention, derived from formula II (see ABC02021), that that bind BAFF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  APRIL; BAFF; immune disorder; immunomodulator; antiinflammatory; cancer; cytostatic; neoplasm; immunosuppressive; therapeutic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polypeptides that inhibit APRIL and/or BAFF binding to BCMA, useful for treating immune-related disease, cancer or T-cell mediated disease such as graft rejection, graft versus host disease (GVHD) and
                                                                                                                                                                                                                 New polypeptides that inhibit APRIL and/or BAFF binding to BCMA, usefurer treating immune-related disease, cancer or T-cell mediated disease such as graft rejection, graft versus host disease (GVHD) and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Length 34;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The specification describes polypeptides that bind APRIL or BAFF. The polypeptides inhibit APRIL or BAFF binding to B-cell maturation antigen (BCMA). APRIL and BAFF are tumor necrosis family (TNF) members. The polypeptides of the invention are useful for treating immune-related diseases, such as rheumatoid arthritis, multiple sclerosis, and systemic lupus erythematosus; cancer such as leukemia, lymphoma, or multiple scleroms, or T-cell mediated disease such as graft rejection, graft versus host disease (GYHD) and inflammation. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     APRIL; BAFF; immune disorder; immunomodulator; antiinflammatory; cancer; cytostatic; neoplasm; immunosuppressive; therapeutic.

```
recombinant anti-cell death gene and a reporter gene operably linked to the promoter, and then determining whether the expression of the reporter gene is altered as a result of contect with library. The method is useful for identifying polypeptides which increase or decrease gene expression from a promoter. The BCMA polypeptide or nucleic acid are useful for preparing a pharmaceutical composition for treating cancer, apoptosis, viral infections, inflammatory response, such as rheumatory arthritis, inflammatory bowel disease or septic shock. BCMA is useful for identifying compounds that modulate NF-kB expression and thus for drug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 MAQQCFHSEYFDSLLHACKPCHLRCSN--PPATCQPYCDPSVTSSVKG 46

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a BCMA (not defined) polypeptide. BCMA is a necrosis factor (NF)-kB activator. The method of the invention is used to identify compounds which modulate BCMA activity (and thus NF-kB activity). The specification describes a method of identifying a polypeptide which increases gene expression from a promoter. The method involves contacting a library of with a cell which expresses a
                                                                                                                               The specification describes polypeptides that bind APRIL or BAFF. The polypeptides inhibit APRIL or BAFF binding to B-cell maturation antigen BCMA). ARRIL and BAFF are tumor necrosis family (TNF) members. The polypeptides of the invention are useful for treating immune-related diseases, such as rheumatoid arthritis, multiple sclerosis, and systemic lupus erythematosus; cancer such as leukemia, lymphoma, or multiple scleroms, or to select a scleroms or the present sequence of disease (GYHD) and inflammation. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            BCMA, necrosis factor-kB activator, NF-kB, gene expression, cancer, anti-cell death gene, apoptosis, viral infection, inflammatory response, rheumatoid arthritis, inflammatory bowel disease, septic shock.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 death

related Leucocyte expressed Ligand 1 (TALL-1) nucleic acid molecules, proteins (including homologues), and their antibodies. The invention in particular relates to methods for regulating the interaction between TALL-1 and TALL-1 receptors (BCMA referred as B cell maturation factor) to regulate monocyte, macrophage and B lymphocyte mediated immune responses TALL-1 protein is useful for identifying compounds that regulate B lymphocyte proliferation. It is also useful for treating B lymphocyte

                                                                                                                                                                                                                                                                                                   g
```

The invention relates to a method for inhibiting TACI (transmembrane activator and intracellular CAML interactor) and/or B cell maturation protein (BCMA) activity in a mammal. The method comprises administering specific binding partner for APRIL (G70, a tumour necrosis factor-TNF family ligand), having the consensus region of TACI, BCMA, or the TACI/BCMA extracellular region of TACI or BCMA. The method is useful for inhibiting activity of TACI and/or BCMA. The method is useful for treating B-cell or I-cell and/or BCMA in a mammal which is useful for treating B-cell or I-cell

```
The invention provides novel tumor necrosis factor receptor ztnfr14 polynucleotides ADZ67753 and polypeptides ADZ67754, expression vectors and antibodies. Human zuffr14 polynucleotides are used in claimed methods for detecting a genetic abnormality in a patient and for detecting a cancer in a patient. Recombinant ztnfr14 polypeptide, optionally conjugated to a toxin, is used in a claimed method of killing cancer cells. Ztnfr14 polypeptides can be used to detect ligands, agonists and antagonists. The polypeptides, polynucleotides and antibodies may also be used in methods that modulate tumor growth, metastasts, and immunity such as separating resting from stimulated immune cells. The present sequence is that of murine TNRR BOWA. This sequence was compared with that of murine ztnfr14 ADZ67756 in the identification of ztnfr14 as a member of
                                                                                                                                                                                                                                                                                              ä
     gastrointestinal, pancreatic or prostate tumour. APRIL, BCMA and TACI antagonists are useful for treating inflammation and immune function diseases such as diarrhoea, psortasis, allergies pneumonia, atopic diseases such as diarrhoea, psortasis, allergies pneumonia, atopic disease), drug and insect sting allergy, inflammatory bowel disease (Crohn's disease, colitis), scleroderma, autoimmune disease (multiple sclerosis, rheumatoid arthritis, systemic lupus erythematosus), fungal, bacterial, protozoal and viral infections (HIV), atherosclerosis, cancer with leucocyte infiltration of the skin or organs. The present sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method for inhibiting TACI (transmembrane activator and intracellular CAML interactor) and/or B cell maturation protein (BCMA) activity in a mammal. The method comprises administering a specific binding partner for APRIL (G70, a tumour necrosis factor-TNF family ligand), having the consensus region of TACI, BCMA, or the TACI/CCC BCMA in a mammal which is useful for inhibiting activity of TACI and/or BCMA in a mammal which is useful for treating B-cell or T-cell and/or BCMA in a mammal which is useful for treating B-cell or T-cell and/or BCMA in a mammal which is useful for treating B-cell or T-cell and/or BCMA in a mammal which is useful for treating B-cell or T-cell canceractive disorders, one or more solid tumours such as lung, gastrointestinal, pancreatic or prostate tumour. APRIL, BCMA and TACI areagonists are useful for treating inflammation and immune function diseases such as diarrhea, psoriasis, allergies, pneumonia, atopic dermatitis, respiratory allergic disease (asthma, hypersensitivity lung disease), drug and insect sting allergy, inflammatory bowel disease

(Crohn's disease, colitis), scleroderma, autoimmune disease (multiple

```
The invention relates to a novel TALL-1-binding polypeptide comprising a defined sequence in the specification. The composition is useful in medulating the activity of TALL-1, and in treating, preventing, ameliorating, diagnosing or prognosing a B-cell-mediated autoimmune disease (e.g. systemic lupus erythematosus) or B-cell-mediated cancer or lymphoma. The composition may also be used in treating inflammations (e.g. rheumatoid arthritis), acute pancreatitis, Alzheimer's disease, asthma, atherosclerosis, cachexia, cirrhosis, diabetes glomerulomephritis, Hashimoto's thyroiditis, ischemic injury, multiple myeloma, multiple sclerosis, osteoporosis, Parkinson's disease, psoriaeis and vasculitis. Disorders may be treated with the novel composition using gene therapy. This sequence represents a TALL-1 related protein of the
                                                                                                                                           TALL-1-binding protein; TALL-1; B-cell-mediated autoimmune disease; systemic lupus erythematosus; B-cell-mediated cancer; lymphoma; inflammation; rheumatoid arthritis; acute pancreatitis, atherosclerosis; Alzheimer's disease; asthma; cachexia; cirrhosis; diabetes; osteoporosis; glomerulonephitis; Hashimoto's thyroiditis; ischaemic injury; psoriasis; multiple myeloma; multiple sclerosis; Parkinson's disease; vasculitis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New TALL-1-binding polypeptide, useful for modulating the activity of TALL-1 and in treating, preventing or diagnosing a B-cell-mediated autoimmune diseases, cancers or lymphomas.
                                                                                                             TALL-1 related protein SEQ ID No 197.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Disclosure; Page 26; 236pp; English.

The invention relates to a neutrokine-alpha protein in crystalline form. The crystalline neutrokine-alpha protein is useful for designing molecules that have biological erivity or compounds that bind, inhibit or mind a neutrokine-alpha protein and/or enhance the activity of a neutrokine-alpha protein. The three-dimensional structure of a neutrokine-alpha protein. The three-dimensional structure of a neutrokine-neutrokine-alpha protein in determining the three-dimensional of other neutrokine-alpha proteins and their homologs. The compounds that minic, prevent or inhibit the activity of the protein are useful for treating ancest allergic disorders, or autoimmune diseases such as rheumatoid arthritis, multiple sclerosis, Crohn's disease, diabetes, systemic lupus erythematosus or asthma. This sequence represents the residues in the

The invention relates to a method for inhibiting TACI (transmembrane activator and intracellular CAML interactor) and/or B cell maturation protein (BrOAM) activity in a mammal. The method comprises administering a specific binding partner for APRLI (GTO, a tumour necrosis factor-TNF family ligand), having the consensus region of TACI, BCMA, or the TACI/ BCMA extracellular region of TACI and/or BCMA. The method is useful for inhibiting activity of TACI and/or BCMA in amammal which is useful for treating B-cell or T-cell lymphoproliferative disorders, one or more solid tumours such as lung, gastrointestinal, pancreatic or prostate tumour. APRLI, BCMA and TACI antagonists are useful for treating inflammation and immune function diseases such as diarrhoea, psoriasis, allergies, pneumonia, atopic dermatitis, respiratory allergic disease (lathma, hypersenaitivity) ung disease, colitis), scleroderma, autoimmune disease (mutiple cleronis, rheumatoid arthritis, systemic lupus erythematosus), fungal, bacterial, protozoal and viral infections (HIV), atherosclerosis, equence with leucocyte infiltration of the Stin or organs. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Inhibiting activity of B cell maturation protein and/or transmembrane activator and intracellular cyclophilin ligand interactor, by administering a binding partner for APRIL, a tumor necrosis factor family
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        is human-murine B cell maturation protein (BCMA) consensus sequence. The invention relates to a method for inhibiting TACI (transmembrane activator and intracellular CAML interactor) and/or B cell maturation protein (BCMA) activity in a mammal. The method comprises administering a pecific binding partner for APRIL (G70, a tumour necrosis factor-INF family ligand), having the consenus region of TACI, BCMA, or the TACI BCMA extracellular consensus sequence, but not the extracellular region of TACI or BCMA. The method is useful for inhibiting activity of TACI and/or BCMA in a mammal which is useful for treating B-cell or T-cell lymphoproliferative disorders, one or more solid tumours such as lung, gastrointestinal, pancreatic or prostate tumour. APRIL, BCMA and TACI antagonists are useful for treating inflammation and immune function diseases such as diarrhoea, psoriasis, allergies, pneumonia, atopic dermatitis, respiratory allergic disease (athma, hypersensitivity lung disease), drug and insect seting allergy, inflammation, disease (Crohn's disease, colitis), scleroderma, autoimmune disease (multiple sclerosis, rheumatoid arthritis, systemic lupus erythematosus), fungal, bactezoal and viral infections (HIV), atheroselerosis, cancer with leucocyte infiltration of the skin or organs. The present sequence is human-murine B cell maturation protein (BCMA) consensus sequence cysteine rich region. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                cytostatic; B cell maturation protein; BCMA; tumour necrosis factor; TNF; pytpoprofoliferative disorder; tumour; lung; gastroinestinal; pacteatic; prostate; inflammation; immune disorder; diarrhoea; psoriasis; colitis; drug allergy; dermatitis; pneumonia; asthma; inflammatory bowel disease; colon's disease; scleroderma; autoimmune disease; multiple sclerosis; human immunodeficiency virus; HIV; systemic lupus erythematosus; cancer; rheumatoid arthritis; atherosclerosis; mouse.

The present sequence represents murine zinf4, a tumour necrosis factor ligand. The extracellular domains of BR43x2 (an isoform of the transmembrane activator and CAML-interactor (TACI) receptor). TACI or transmembrane activator and CAML-interactor (TACI) receptor). TACI or ECHA activity. They may also be used for inhibiting that activity. They may also be used for inhibiting SR43x2. TACI or BCMA receptor-ligand engagement associated with activated or resting B lymphocytes, effector T-cells, or with antibody production. The antibody production is associated with an autoimmune disease selected from systemic lupus erythematosus, myasthenia gravis, multiple sclerosis and rheumatoid arthritis. The zinf4 activity and BR43x2, TACI or BCMA receptor-ligand engagement is associated with asthma, bronchitis, emphysema, end stage renal failure, glomerulonephritis, vasculitis, ceptor-ligand engagement incoplasms, multiple myelomas, lymphomas, light chain neuropathy, amyloidosis, moderating immune response. Immunosuppression, graft rejection, graft versus host disease, joint inflammation, insulin dependent diabetes mellitus, Crohn's disease,

The sequences are useful for: (i) for screening drug candidates; (ii) for screening of binding to Carcinoma Associated Protein (CAP); (iii) for screening of binding to Carcinoma Associated Protein (CAP); (iii) for screening of a bioactive agent capable of modulating the activity of CAP; (iv) for candidate carcinoma drug; (v) for diagnosing carcinoma; (vi) for inhibiting the activity of CAP; (vii) for treating carcinoma; (vii) for neutralizing the effect of CAP; (vii) for treating carcinoma; (viii) for neutralizing the effect of CAP; (ix) as a biochip; (x) for diagnosing carcinoma or a propensity to carcinoma; and (xi) for determining Carcinoma Associated (CA) gene copy number. In addition, the CA genes are useful as Markers of carcinoma including lymphoma. The present sequence is one such CAP: Note: This patent is an equivalent to basic patent US2002182586A1, for which no sequence data was published
                                                                                                                                                                 ij

The invention provides novel tumor necrosis factor receptor (TNFR) ztnfr14 polynucleotides ADZ67754, expression vectors and antibodies. Human ztnfr14 polynucleotides are used in claimed methods for detecting a genetic abnormality in a patient and for detecting a cancer in a patient. Recombinant ztnfr14 polypeptide, optionally conjugated to a toxin, is used in a claimed method of killing cancer cells. Ztnfr14 polypeptides can be used to detect ligands, adonists and antagonists. The polypeptides, polynucleotides and antibodies may also be used in methods that modulate tumor growth, metastagis, and immunity such as separating resting from stimulated immunity such as esparating resting from stimulated immune cells. The present sequence is that of murine TNFR TARLIA in the identification of ztnfr14 as a member of the TNFR family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Tumor necrosis factor receptor superfamily member 13b protein, SEQ: 54.

                                                                                                                                                                  The invention describes a transgenic mouse (I) comprising a disruption in an subtilisin-like protein convertase (SPC6) gene, where there is no native expression of an endogenous SPC6 gene. The therapeutic agent is administered by inhalation or insufflation or oral, buccal, parenteral, topical, subcutaneous, intraperitoneal, intravenous, intrapleural, intraocular, intraarerial, or rectal route. The transgenic mouse and associated methods are useful for identifying potential therapeutic agents (e.g. SPC6 agonists and antagonists) for treating conditions associated with SPC6. The identified agents are potentially useful for treating diseases such as schizophrenia. The mouse is useful for investigating the biological roles of SPC6. This is the amino acid sequence of mouse SPC6.
                                                          New transgenic mouse useful in methods for identifying potential therapeutic agents for treating a variety of diseases, including schizophrenia, comprises a disruption in a subtilisin-like protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Length 1548;

                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a method of characterizing proteins present in the plasma membrane (PM) of live calls. The proteins of the invention are useful in identifying diagnostic markers and potential drugs. The invention is useful for identifying drugs for diagnosing and treating disorders unto as cancer which are associated with abnormal representation of cell surface proteins. The present sequence is mouse tumor necrosis factor receptor superfamily member 13b protein.

This sequence shows a murine subtilase. The homologous human subtilase coding sequence is located on chromosome 9q21.13. Related EST's are expressed in Kidney (renal cell adenocarcinoma), head and neck tissue, heart, multiple sclerosis lesions, cervix, pooled garm cell tumours, uterus tumour, adenocarcinoma, retina II and stomach. The subtilisin of protein is a long membrane bound protein which shows 96% identity to chuman proprotein convertase subtilisin. There are two blocks of 11 furinise repeats in the C-terminal portion. Sew suggesting that the cransmembrane domain, also in the C-terminal portion. Suggesting that the protein is localised on the outside of the membrane. The subtilase cransmembrane domain, also in the C-terminal portion, suggesting that the polymucleotide and polypeptide are useful for identifying test compounds, which may act a sagonists or antagonists at the receptor site and which can be regulated to provide therapeutic effects. Vectors comprising the objuncleotide are useful for modulating the activity of subtilase in a disorder, cancer, a cardiovascular disorder, a gastrointessinal calsorder, cancer, a cardiovascular disorder, a gastrointessinal calsorder, cancer, a cardiovascular disorder, a gastrointessinal compassions of disease, pain, colon tumour, pre-oscophageal dysphagia, cansplant rejection, pelvic pain, reconstruction, ovary tumour, cardinar diseases, etc. These are also useful for preventing or congestive heart failure, myocardial infarction, ischaemia, hypertensive cameliorating the diseases cited above
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Transmembrane activator; calcium modulator; nephrotropic; antibacterial; TACI; tumour necrosis factor-like protein; ZTNF2; ZTNF4; immunoglobulin; antimiflammatory; immunosuppressive; glomerulonephritis; acthma; bronchitis; graft rejection; septic shock; dermatological; neuroprotective; cyclophilin ligand-interactor; human; autoimmune disease; systemic lupus erythematosus; multiple sclerosis; diabetes mellitus; rheumatoid arthritis; renal disease; inflammation; mouse; FCS protein; chimeric.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human TACI-Fc5 fusion protein comprising murine 26-10 VH signal peptide.
identifying modulators of subtilase activity, and in gene therapy for treating e.g. Alzheimer's disease, cancers, congestive heart failure or

The invention relates to fusion proteins comprising transmembrane activator and calcium modulator and cyclophilin ligand-interactor (TACI) receptor group that binds tumour necrosis factor-like protein (ZTNF)2 or ZTNF9; and an immunoglobulin group comprising a constant region of an immunoglobulin. The invention is used to manufacture a medicament for inhibiting the proliferation of tumour cells in a mammallan subject. The composition comprising the fusion protein may also be used in treating autoimmune diseases (e.g. systemic lupus erythematosus, multiple solerosis, diabetes mellitus, rheumatoid arthritis and asthma), renal diseases (e.g. glomerulonephritis), bronchitis, inflammation, graft crejection, anaemia and septic shock. The fusion proteins are also used in comprising murine 26-10 VH signal peptide. This sequence is used in the invention. (Updated on 23-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antibacterial; Virucide; Antiallergic; Antiasthmatic; Antiinflammatory; Ophthalmological; Auditory; Vulnerary; Gastrointestinal; Cytostatic; Gene Therapy; Mucin-like protein; human; mucin; bacterial infection; allergic asthma; inflammation; viral infection; allergic conjunctivitia; otitis; tissue injury; epithelial wounding; inflammatory bowel disease; Crohn's disease; small adenocarcinoma of the lung; lung cancer; gastric intestinal metaplasia; chronic cholecystitis; skin cancer;
                                                                                                                    Transmembrane activator and calcium modulator and cyclophilin ligand-
interactor (TACI)-immunoglobulin fusion protein, for treating cancer o
diabetes, comprises a TACI receptor group and an immunoglobulin group.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gape

The present invention relates to novel mucin-like proteins (I) and their coding sequences. The mucin-like proteins and coding sequences are useful in the therapy or in the prevention of a disease when the increase in the mucin-like activity of a polypeptide is needed e.g. bacterial infections, allergic asthma, inflammation, respiratory syncytial virus (RSV)-induced disease, allergic conjunctivitis, otitis, tissue injury, epithelial adenocarcinoma of the lung, lung cancer, Crohn's disease, small adenocarcinoma of the lung, lung cancer. The present sequence is a mucin glycoprotein which was used in a sequence alignment with the mucin-like
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated mucin-like polypeptides, useful for diagnosing or treating, eg. bactecrial infections, allergic asthma, inflammation, allergic conjunctivitis, otitis, inflammatory bowel disease, Crohn's disease, lung cancer, or skin cancer.
                               New isolated mucin-like polypeptides, useful for diagnosing or treating, e.g. bacterial infections, allergic asthma, inflammation, allergic conjunctivitie, ottiis, inflammatory bowel disease, Crohn's disease, lung cancer, or skin cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antibacterial; Virucide; Antiallergic; Antiasthmatic; Antiinflammatory; Ophthalmological; Auditory; Vulnerary; Gastrointestinal; Cytostatic; Gene Therapy; Mucin-like protein; human; mucin; bacterial infection; allergic asthma; inflammation; viral infection; allergic conjunctivitis; officis; tissue injury; epithelial wounding; inflammatory bowel disease; Crohn's disease; small adenocariome of the lung; lung cancer; gastric intestinal metaplasia; cholecystitis; skin cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Mature Human mucin-like protein, SCS0004, variant SEQ ID 4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1179 CSQDEYFDHEEGVCVPCM-----PPTTPQ 1202

The present invention relates to novel mucin-like proteins (I) and their coding sequences. The present sequence is one such human mucin-like proteins and coding sequences are useful in the therapy or in the prevention of a disease when the increase in the mucin-like activity of a polypeptide is needed e.g. bacterial infections, allergic asthma, inflammation, respiratory syncytial virus (RSV)-induced wounding, inflammatory bowel disease, tissue injury, epithelial wounding, inflammatory bowel disease, Crohn's disease, small adenocarcinoma of the lung, lung cancer, gastric intestinal metaplasia, chronic cholecystitis, or skin cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated mucin-like polypeptides, useful for diagnosing or treating, e.g. bacterial infections, allergic asthma, inflammation, allergic conjunctivitis, otitis, inflammatory bowel disease, Crohn's disease, lung cancer, or skin cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to novel mucin-like proteins (I) and their coding sequences. The present sequence is one such human mucin-like protein. The mucin-like proteins and coding sequences are useful in the therapy or in the prevention of a disease when the increase in the mucin-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antibacterial; Virucide; Antiallergic; Antiasthmatic; Antiinflammatory; Ophthalmological; Auditory; Vulnerary; Gastrointestinal; Cytodetatic; Gene Therapy; Mucin-like protein; human; mucin; bacterial infection; allergic asthma; inflammation; viral infection; allergic conjunctivitis; otitis; tissue injury; epithelial wounding; inflammatory; bowel disease; Crohn's disease; small adenocarchone of the lung; lung cancer; gastric intestinal metaplasia; chronic cholecystitis; skin cancer.

New isolated mucin-like polypeptides, useful for diagnosing or treating, e.g. bacterial infections, allergic asthma, inflammation, allergic conjunctivitis, otitis, inflammatory bowel disease, Crohn's disease, lung cancer, or skin cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to novel mucin-like proteins (I) and their coding sequences. The present sequence is one such human mucin-like protein. The mucin-like proteins and coding sequences are useful in the therapy or in the prevention of a disease when the increase in the mucin-like activity of a polypeptide is needed e.g. bacterial infections, allergic asthma, inflammation, respiratory syncytial virus (RSV)-induced disease, allergic conjunctivitis, otitis, tissue injury, epithelial wounding, inflammatory bowel disease, Crohn's disease, small adenocarcinoma of the lung, lung cancer, gastric intestinal metaplasia, chronic cholecystitis, or skin cancer.
like activity of a polypeptide is needed e.g. bacterial infections, allergic asthma, inflammation, respiratory syncytial virus (RSV)-induced disease, allergic conjunctivitis, otitis, tissue injury, epithelial wounding, inflammatory bowel disease, Crohn's disease, small adenocarcinoma of the lung, lung cancer, gastric intestinal metaplasia, chronic cholecystitis, or skin cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antibacterial; Virucide; Antiallergic; Antiasthmatic; Antiinflammatory; Ophthalmological; Auditory; Vulnerary; Gastrointestinal; Cytostatic; Gene Therapy; Mucin-like protein; human; mucin; becterial infection; allergic asthma; inflammation; viral infection, allergic conjunctivitis; otitis; tissue injury; epithelial wounding; inflammatory bowel disease; Crohn's disease; small adenocarcinoma of the lung; lung cancer; gastric intestinal metaplasia; chronic cholecystitis; skin cancer.
                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                             1,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         His-tagged Human mucin-like protein, SCS0004, variant SEQ ID 5.
                                                                                                                                                                             Length 2258;

The invention relates to a composition (I) comprising AGP-3 receptor (tumour necrosis factor ligand family member) related protein (II) at attached to a vehicle protein. (I) is useful for modulating AGP-3-related attached to a vehicle protein. (II) is useful in assays to identify cells and tissues that express AGP-3R or proteins casays to identify cells and tissues that express AGP-3R or proteins or attagonists) that interact with AGP-3R proteins and goon service or antagonists) that interact with AGP-3R proteins. (II) is also useful or identifying intracellular proteins that interact with the respective cycoplasmic domains by yeast two-hybrid screening process. (II) is cytoplasmic domains by yeast two-hybrid screening process. (II) is completed in B cell growth, survival and activation particularly in lymph conde, spleen, and Peyer's patches. AGP-3R agonists and antagonists of identified using (II) are used for modulating B cell response and are used to rreat diseases characterised by inflammatory processes or cycoplated immune response such as rheumatoid arthritis, graft-versus-cycoplated immune response such as rheumatoid arthritis, graft-versus-cycoplated immune response such as rheumatoid arthritis, graft-versus-cycoplated immune response such as rheumatoid arthritis, which conditions of joints, e.g., rheumatoid creatment of inflammatory conditions of joints, e.g., rheumatoid consecuence of arthritis, osteoarthritis, amyotrophic lateral sclerosis cuseful for treating acute pancreatitis, amyotrophic lateral sclerosis (ALS), Alzheimer's disease, asthma, atherosclerosis, cachexia/anorexia, disbates, geven glomerulonephritis, inflammatory bowel disease,

Ztnfr14 polynucleotides are used in claimed methods for detecting a genetic abnormality in a patient and for detecting a cancer in a patient. Recombinant ztnfr14 polypeptide, optionally conjugated to a toxin, is used in a claimed method of killing cancer cells. Ztnfr14 polypeptides and be used to detect ligands, agonists and antagonists. The polypeptides, polynucleotides and antibodies may also be used in methods that modulate tumor growth,
                              sclerosis, osteoporosis, Parkinson's disease, pain, reperfusion injury, septic shock, etc. The nucleic acids are also useful for developing transgenic animals expressing (II), which are useful for producing the polypeptides and for the study of in vivo biological activity. The present sequence represents the amino acid sequence of human AGP-3 cysteine-rich repeat region #1
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New tumor necrosis factor receptor (TNFR) polypeptides, useful as detecting ligands, and for modulating tumor growth, metastasis and immunity, such as separating resting from stimulated immune cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         necrosis factor receptor; TACI; cancer; neoplasm; diagnosis;

crivator and intracellular CAMI, interactor) and/or B cell maturation protein (BCMA) activity in a mammal. The method comprises administering a specific binding partner for ARRIL (GTO), a tumour necrosis factor-INF specific binding partner for ARRIL (GTO), a tumour necrosis factor-INF amily ligand), having the consensus requence, but not the extracellular region of TACI BCMA, or the TACI BCMA extracellular consensus sequence, but not the extracellular region of TACI or BCMA in a mammal which is useful for inhibiting activity of TACI conformance of TACI or BCMA in a mammal which is useful for treating B-cell or T-cell lymphoproliferative disorders, one or more solid tumours such as lung, gastrointestinal, pancreatic or prostate tumour. ARRIL, BCMA and TACI antagonists are useful for treating inflammation and immune function diseases such as diarrhoea, psoriasis, allergies, pneumonia, atopic dermatitis, respiratory allergic disease (acthma, hypersensitivity lung disease), drug and insect sting allergy, inflammatory bowel disease (Crohn's disease, colitis), scleroderma, autoimmune disease (multiple sclerosis, rheumatoid arthritis, systemic lupus erythematosus), fungal, bacterial, protozoal and viral infections (HIV), atherosclerosis, cancer with laucocyte infiltration of the skin or organs. The present sequence is human TACI cysteine-rich extracellular region

This is the amino acid sequence of the N-terminal, i.e. the extracellular, domain of novel human transmembrane activator and CAML-cinteractor (TACI) protein (see AAW75783). TACI is a lymphocyte receptor protein that is involved in the calcium activation pathway. It is normally present in B-lymphocytes, and to a much lesser extent in impact of the capture T-lymphocytes, and can therefore be targetted to specifically regulate B cell responses without affecting T cell activity. The extracellular domain of TACI functions as a binding site for a ligand that atimulates the activation of the cell by inducing the binding of the cterminal portion (see AAW75784) of TACI to the N-terminal domain of CAMI. A recombinant form of the extracellular portion of TACI acts as a dominant-negative or blocking agent and acts to suppress the immune system. It can be used to treat or prevent autoimmune disease, graft rejection or graft versus host disease. The extracellular region is also used in a claimed method for identifying a ligand for TACI, in which binding of a candidate molecule is determined by detecting cellular cut activation of the AP-1, CAMP or NF-XB pathway, of NF-AT transcription contraction, or of NF-AT dependent transcription

The invention relates to a method for inhibiting TACI (transmembrane activator and intracellular CAML interactor) and/or B cell maturation protein (BCMA) activity in a mammal. The method comprises administering a protein (BCMA) activity in a mammal. The method comprises administering a specific binding partner for APRIL (G70, a tumour necrosis factor-TNF family ligand), having the consensus region of TACI, BCMA, or the TACI/ BCMA extracellular consensus sequence, but not the extracellular region of TACI of TACI or BCMA, in a mammal which is useful for inhibiting activity of TACI and/or BCMA, in a mammal which is useful for treating B-cell or T-cell lymphoproliferative disorders, one or more solid tumours such as lung, gastrointesthal, pancreatic or prostate tumour. APRIL, BCMA and TACI antagonists are useful for treating inflammation and immune function diseases such as diarrhoea, psoriasis, allergies, pneumonia, atopic dermatities, respiratory allergi, disease (asthma, hypersensitivity lung disease), drug and insect sting allergy, inflammatory bowel disease (Crohn's disease, colitis), scleroderma, autoimmune disease (multiple sclerosis, theumatorid arthrities, systemic lupus erythematosus), tungal, bacterial, protozoal and viral infections (HIV), atherosclerosis, cancer with leucocyte infiltration of the skin or organs. The present sequence is a human TACI protein extracellular domain 23.9%; Score 67.5; DB 5; Length 166; Sequence 166 AA; Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              extracellular domain of the transmembrane activator and calcium-signal modulating cyclophilin ligand (CAML) interactor (TACI), and a trimerising polypeptide. Also described: (1) a homotrimeric protein complex comprising the polypeptide; (2) an expression vector comprising the following operably linked elements, a transcription promoter, the nucleic acid sequence encoding the polypeptide, and a transcription terminator; (3) a cultured cell into which has been introduced the expression vector, where the cell expresses the polypeptide; (4) producing a homotrimeric protein complex by culturing the cell, and recovering the homotrimeric protein complex, and (5) inhibiting tumour necrosis factor (TNF) 4-induced B cell proliferation by exposing the B cells to the homotrimeric protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            complex. The polypeptide has antiinflammatory, antiarthritic, activities, immunosuppressive, antiarteriosclerotic and cytostatic activities, and can be used in gene therapy. The polypeptides are useful for treating and controlling inflammatory diseases, e.g. rheumatoid arthritis or inflammatory bowel disease, autoimmune disease, attherosclerosis, osteoporosis, allograft rejection and cancer. The present sequence represents a human TACI and heat shock binding protein (HSBP) fusion protein fragment, which is used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                             transmembrane activator and CAML interactor; TACI; extracellular domain; trimerising polypeptide; homotrimeric protein complex; antiinflammatory; antiarthritic; antirheumatic; immunosuppressive; antiarteriosclerotic; cytostatic; gene therapy; inflammatory disease; rheumatoid arthritis; inflammatory bowel disease; autoimmune disease; atherosclerosis; osteoporosis; allograft rejection; cancer; human; heat shock binding protein; HSBP; fusion protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New polypeptide comprising an extracellular domain of the transmembrane

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to methods of using one or more agonists or antagonists to modulate the activity of the members of TNF (tumour necrosis factor) especially TALL-1, APRIL and TNF receptor (TNFR) e.g. TACI or BCMA. The method is useful for treating pathological conditions or diseases associated with increased TALL-1 and APRIL expression or between APRIL and APRIL antagonists are used to block the interaction between APRIL and TALL-1 with TACI or BCMA. They are useful for treating a mammal suffering from cancer such as leukaemia, lymphoma, myeloma, architis, multiple sclerosis, psoriasis and lupus erythematosid arthritis, multiple sclerosis, psoriasis and lupus erythematosus. The present sequence is human TACI splice variant protein
                                                                                                                                                                                                                                                                                                                                                                                                      Human; TNF; tumour necrosis factor; TALL-1; APRIL; TNF receptor; TNFR; TACI; BCMA; therapy; cancer; leukaemia; myeloma; lymphoma; autoimmune disease; rheumatoid arthritis; multiple sclerosis; psoriasis.
